Principle and Interpretation

Yeast Nitrogen Base (YNB) w/ Ammonium Sulphate, w/o Phosphates, w/o Sodium Chloride is used for the growth of all strains of *Saccharomyces cerevisiae*. This yeast strain is called budding yeast and is extensively studied microorganism in molecular and cell biology.

Yeast Nitrogen Base (YNB) w/ Ammonium Sulfate w/o Phosphates, w/o Sodium Chloride is developed according to the formulae of Wickerham (1) and Burkholder (2) which supplies the required nutritional elements for budding yeast cells. This media is used for the classification of yeast strains based on the carbon and nitrogen requirements and it contains all the essential vitamins and inorganic salts except Potassium phosphate and Sodium chloride which are required for the propagation of yeast cells. Furthermore, this media does not contain the amino acids namely, histidine, methionine, leucine, lysine and tryptophan.
