## Principle and Interpretation

SDA Growth Medium w/o HIS-LEU-TRP is a synthetic defined agar media for the selective growth of *Saccharomyces cerevisiae*. Synthetically Defined media known as Yeast Nitrogen Base Media for the growth of yeast cells were first cited by Wickerham (1, 2). Synthetic defined Growth Medium w/o HIS-LEU-TRP includes a yeast nitrogen base along with ammonium sulfate and dextrose as the carbon source, which is further supplemented with various nutrients except histidine, leucine and tryptophan. This makes it a triple dropout growth medium for yeast cells. A histidine, leucine and tryptophan auxotrophic yeast mutant strain cannot grow on this media but a wild-type or a histidine, leucine and tryptophan prototrophic yeast strain can grow. The histidine, leucine and tryptophan auxotroph has mutation in the genes (e.g. *HIS3*, *LEU2* and *TRP1*) of the histidine, leucine and tryptophan synthesis pathway and this mutant strain will grow in this medium if histidine, leucine and tryptophan are supplied from outside e.g. from plasmids which contain *HIS3*, *LEU2*, *TRP1* genes (3). For this purpose, a *his3leu2trp1* mutant strain of *S. cerevisiae* is transformed with *HIS3*, *LEU2*, *TRP1* containing plasmid and the transformants can be selected by growing the cells on SD Growth Medium w/o HIS-LEU-TRP.
