

Technical Information

Sellers Differential Agar

Product Code: DM 1293

Application: - Sellers Differential Agar is used for differentiation and identification of gram-negative non-fermentative bacilli especially *Pseudomonas aeruginosa* and *Acinetobacter calcoaceticus*.

Composition**

Composition						
Ingredients	Gms / Litre					
Yeast extract	1.000					
Peptic digest of animal tissue	20.000					
L-Arginine	1.000					
D-Mannitol	2.000					
Sodium chloride	2.000					
Sodium nitrate	1.000					
Sodium nitrite	0.350					
Magnesium sulphate	1.500					
Dipotassium phosphate	1.000					
Bromo thymol blue	0.040					
Phenol red	0.008					
Agar	15.000					
Final pH (at 25°C)	6.7±0.2					
**Formula adjusted, standardized to suit performance parameters						

^{*}Formula adjusted, standardized to suit performance parameters

Principle & Interpretation

Sellers Differential Agar is devised by Sellers ⁽¹⁾ for differentiation and identification of non-fermentative gram-negative bacilli especially Pseudomonas aeruginosa, Acinetobacter calcoaceticus and Alcaligens faecalis. The medium is complex having differentiation ability based on oxidation of dextrose, fluorescence, production of nitrogen and pH changes.

Yeast extract and peptic digest of animal tissue are the sources of carbon and nitrogen compounds as well as vitamins and minerals. Oxidation of dextrose by the organisms is readily visible as a yellow band at the slant-butt junction. The dextrose added prior to inoculation diffuses into the medium during incubation period. *P. aeruginosa* exhibits acid reaction from dextrose. However, the reaction is masked by deamination of arginine and high peptone concentration. Most of *Acinetobacter* species produce a yellow band due to glucose oxidation. This band may disappear after 24 hours. D-Mannitol and magnesium sulphate stimulate fluorescence while nitrogen gas production is stimulated by dipotassium phosphate ^{(1, 2).} Sodium nitrate and nitrite serve as substrates for the production of nitrogen gas for denitrifying bacteria. Phenol red and bromothymol blue are the pH indicators. Arginine dihydrolase positive reaction is indicated by the formation of blue colour. Inoculation is done by stabbing deep into the butt and streaking the slant.

Methodology

Suspend 44.89 grams of powder media in 1000 ml distilled water. Shake well &heat to dissolve the medium completely. Dispense in test tubes and sterilize by autoclaving at 15 lbs pressure (121°C) for 10 minutes. Cool the tubed medium in slanted position. Just before inoculation add 0.15 ml or 2 drops of 50% sterile dextrose solution to each slant by letting it run down the side of the tube opposite the slant.

Quality Control

Physical Appearance

Light yellow to pink homogeneous free flowing powder

Gelling

Firm, comparable with 1.5% Agar gel

Colour and Clarity of prepared medium

Green coloured clear to slightly opalescent gel forms in tubes as slants with a butt.

Reaction

Reaction of 4.5% w/v aqueous solution at 25°C. pH: 6.7±0.2

pH range

6.50-6.90

Cultural Response/Characteristics

DM 1293: Cultural characteristics observed after an incubation at 35 - 37°C for 18 - 24 hours.

Organism	Inoculum (CFU)	Growth	Slant	Butt	Band	Fluorescence (underuv)
Acinetobacter baumannii ATCC 19606	50-100	good	blue	green	yellow	negative
Alcaligenes faecalis ATCC 8750	50-100	good	blue	blue-green	none	negative
Pseudomonas aeruginosa ATCC 27853	50-100	good	blue-green	blue-green	blue	negative

Storage and Shelf Life

Dried Media: Store below 30°C in tightly closed container and use before expiry date as mentioned on the label. **Prepared Media:** 2-8⁰ in sealable plastic bags for 2-5 days.
